Correction to neurosyphilis treatment

In the section regarding management of neurosyphilis including neurological/ophthalmic involvement in early syphilis, the second option for treatment is stated “(2) Benzylpenicillin 18–24 MU daily, given as 3–4 MU i.m. every four hours for 17 days.”
The correct route of administration of the Benzylpenicillin is intra-venously not intra-muscularly; therefore the corrected paragraph reads “(2) Benzylpenicillin 18–24 MU daily, given as 3–4 MU i.v. every four hours for 17 days (III, C).”
